1 B Numpy

This is part of the Python lecture given by Christophe Morisset at IA-UNAM. More informations at: <http://python-astro.blogspot.mx/>

1.0.1 Import numpy first

```
In [2]: # You need first to import the numpy library (must be installed on your computer ;- )
# As it will be widely used, better to give it a nickname, or an alias. Traditionnaly, it's "np"
import numpy as np

In [3]: print np.__version__
```

1.9.1

1.0.2 Tutorials

<http://nbviewer.ipython.org/github/jrjohansson/scientific-python-lectures/blob/master/Lecture-2-Numpy.ipynb> AND <http://nbviewer.ipython.org/gist/rpmuller/5920182> AND http://www.astro.washington.edu/users/vanderplas/Astr599/notebooks/11_EfficientNumpy

1.0.3 The ARRAY class

Create an array

```
In [5]: # Easy to create a numpy array (the basic class) from a list
l = [1,2,3,4,5,6]
print(l)
a = np.array([1,2,3,4,5,6])
print(a)
print(type(a))
# Works with tuples also:
b = np.array((1,2,3))
print(b)
```

```
[1, 2, 3, 4, 5, 6]
[1 2 3 4 5 6]
<type 'numpy.ndarray'>
[1 2 3]
```

Numpy arrays are efficiently connected to the computer:

```
In [6]: L = range(1000)
        %timeit L2 = [i**2 for i in L] # Notice the use of timeit, a magic function (starts with %)
        A = np.arange(1000)
        %timeit A2 = A**2
```

```
10000 loops, best of 3: 120 µs per loop
100000 loops, best of 3: 4.22 µs per loop
```

```
In [7]: L = [1, 2, 3, 4]
        a = np.array(L)
        print a.dtype
        print a
```

```
int64
[1 2 3 4]
```

```
In [8]: L = [1,2,3,4.]
        a = np.array(L)
        print a.dtype
        print a
```

```
float64
[ 1.  2.  3.  4.]
```

```
In [9]: L = [1,2,3,4., 'a']
        a = np.array(L)
        print L # Different types can coexist in a python list
        print a.dtype
        print a # NOT in a numpy array. The array is re-typed to the highest type, here string.
```

```
[1, 2, 3, 4.0, 'a']
|S32
['1' '2' '3' '4.0' 'a']
```

Once the type of an array is defined, one can insert values of type that can be transformed to the type of the array

```
In [10]: a = np.array([1,2,3,4,5,6])
         print a
         a[4] = 2.56 # will be transformed to int(2.56)
         print a
         a[3] = '20' # will be transformed to int('20')
         print a
```

```
[1 2 3 4 5 6]
[1 2 3 4 2 6]
[ 1  2  3 20  2  6]
```

```
In [11]: a[2] = '3.2'
```

ValueError

Traceback (most recent call last)

<ipython-input-11-2af1cc391cb1> in <module>()

```
----> 1 a[2] = '3.2'
```

```
ValueError: invalid literal for long() with base 10: '3.2'
```

```
In [12]: a[2] = 'tralala'
```

```
-----  
ValueError                                Traceback (most recent call last)
```

```
<ipython-input-12-f6467d624e31> in <module>()  
----> 1 a[2] = 'tralala'
```

```
ValueError: invalid literal for long() with base 10: 'tralala'
```

1D, 2D, 3D, ...

```
In [17]: a = np.array([1,2,3,4,5,6])  
        b = np.array([[1,2],[1,4]])  
        c = np.array([[[1], [2]], [[3], [4]]])  
        print a.shape, b.shape, c.shape  
        print a[0] # no error
```

```
(6,) (2, 2) (2, 2, 1)  
1
```

```
In [18]: print len(a), len(b), len(c) # size of the first dimension
```

```
6 2 2
```

```
In [19]: b.size
```

```
Out[19]: 4
```

```
In [20]: print a.ndim, b.ndim, c.ndim
```

```
1 2 3
```

```
In [25]: a = np.array([1,2,3,4,5,6])  
        print('mean: {0}, max: {1}, shape: {2}'.format(a.mean(), a.max(), a.shape))
```

```
mean: 3.5, max: 6, shape: (6,)
```

mean and max are methods (functions) of the array class, they need (). shape is an attribute (like a variable).

```
In [26]: print(a.mean) # this is printing information about the function, NOT the result of the function
```

```
<built-in method mean of numpy.ndarray object at 0x106bc8670>
```

```
In [31]: mm = a.mean # We assign to mm the function. Then we can call it directly, but still need for t  
        print(mm())
```

```
3.5
```

```
In [33]: print b
         print b.mean() # mean over the whole array
         print b.mean(axis=0) # mean over the first axis (columns)
         print b.mean(1) # mean over the rows
         print np.mean(b)
```

```

```

Using an array

```
In [93]: print a
          a[[2,4,6]] = -999
          print a
```

```
[0 1 2 3 4 4 3 2 1 0]
[  0   1 -999   3 -999   4 -999   2   1   0]
```

```
In [94]: # a = 1 would turn a to be 1, but if we want to assign 1 to every value in a one must do:
          a[:] = 1
          print a
```

```
[1 1 1 1 1 1 1 1 1 1]
```

1.0.7 Using masks

```
In [95]: a = np.random.random_integers(0, 100, 20) # min, max, N
          print a
```

```
[ 81  86  52  39  52  13 100   9  98  78  46  26  63  86   2  96  45  13
  67  37]
```

```
In [96]: a < 50
```

```
Out[96]: array([False, False, False,  True, False,  True, False,  True, False,
                False,  True,  True, False, False,  True, False,  True,  True,
                False,  True], dtype=bool)
```

```
In [98]: mask = (a < 50)
```

```

In [99]: mask.sum()

Out[99]: 9

In [100]: a[mask]

Out[100]: array([39, 13,  9, 46, 26,  2, 45, 13, 37])

In [101]: b = a.copy() # do NOT use b = a
          b[mask] = 50 #
          print a
          print b

[ 81  86  52  39  52  13 100   9  98  78  46  26  63  86   2  96  45  13
  67  37]
[ 81  86  52  50  52  50 100  50  98  78  50  50  63  86  50  96  50  50
  67  50]

A small comment on the order of the elements in arrays in Python: There is two ways arrays can be stored: row- or column major. It has a direct impact on the way one has to loop on the arrays. IDL is like Fortran (column major) and Python is like C (row major). It means that in Python, as you move linearly through the memory of an array, the second dimension (rightmost) changes the fastest, while in IDL the first (leftmost) dimension changes the fastest. Consequence on the loop order in Python:

```
In [96]: for plane in a:
           for row in plane:
               for col in row:
                   print col
                   print '-----'
```

1.0.9 Broadcasting

<http://arxiv.org/pdf/1102.1523.pdf>

If the two arrays differ in their number of dimensions, the shape of the array with fewer dimensions is padded with ones so that the shape of the two arrays matches in all dimensions. If the shape of the two arrays does not match in any dimension, the array with shape equal to 1 in that dimension is broadcasted to the shape of the other array. If in any dimension the sizes disagree and neither is equal to 1, an error is raised.

1.0.10 Structured arrays and RecArrays

See here: <http://docs.scipy.org/doc/numpy/user/basics.rec.html>

A structured array in numpy is an array of records. Each record can contain one or more items which can be of different types.

```
In [200]: a = np.array([(1.5, 2), (3.0, 4)]) # Classical numpy array
          print a
```

```
[[ 1.5  2. ]
 [ 3.   4. ]]
```

```
In [202]: astru = np.array([(1.5, 2), (3.0, 4)], dtype=[('x', float), ('y', int)]) # array with named a
          astru
```

```
Out[202]: array([(1.5, 2), (3.0, 4)],
                dtype=[('x', '<f8'), ('y', '<i8')])
```

```
In [204]: print astru['x']
          print astru['y']
```

```
[ 1.5  3. ]
[2  4]
```

```
In [146]: arec = astru.view(np.recarray)
          print type(a), type(astru), type(arec)
          print '-----'
          print a
          print astru
          print arec
          print '-----'

In case of doubts, one can use the close function from numpy:

```
In [161]: res_np2 = []
          for i in range(100):
              res_np2.append(np.isclose(float(round(math.log(2 ** i, 2))), math.log(2 ** i, 2)))
          print res_np2
          # The isclose
```

```
[True, True, True, True, True, True, True, True, True, True, True, True, True, True, True, True, True, True,
```

```
In [162]: np.isclose?
```
